

Ismael de la Rosa Guerrero

Backend / Full-Stack Engineer — PHP · Laravel · Python

ismaeldelarosaguerrero@gmail.com · +34 644 969 333 · github.com/ide-la-r · linkedin.com/in/ismael-de-la-rosa-guerrero
Málaga, Spain (CET/CEST) — available for fully remote roles across EMEA and US-overlap hours.

SUMMARY

Backend-leaning full-stack engineer with production experience in multi-tenant Laravel SaaS: ingestion pipelines, queued jobs, REST integrations and LLM-backed features. I own the ingestion and AI layers of a public-procurement platform, where my work is measured in uptime, query latency and API cost per request. I work daily with coding agents (Claude Code, Codex) and treat their output the way I treat any pull request: tested, reviewed and reverted when it is wrong.

EXPERIENCE

Full-Stack PHP Engineer — Mainjobs

May 2026 - Present

Multi-tenant SaaS for Spanish public-sector tender tracking · Laravel 12, Filament, MySQL, Redis queues, Forge

- Own the ingestion layer that feeds the whole product: six regional and EU procurement sources, including attachment download behind captchas and rotating proxies. Fixed region- and deadline-parsing defects that were silently hiding **thousands of tenders** from customers' search results.
- Cut the main tender listing query from **340 ms to 2 ms** by restructuring the ordering and pagination path — the most-used screen in the product.
- Designed the AI layer: a versioned registry that resolves provider and model per service across OpenAI, Anthropic and Gemini, with fallback when a provider has no credentials, per-model cost tracking and threshold alerts. It replaced a setup where one missing environment variable had silently run the catalogue's most expensive model at roughly 10x the cost, with no error anywhere.
- Shipped an LLM proposal generator inside the tender detail view: per-company knowledge sources, plan-based quotas and queued generation, so a long job never blocks a request.
- Ship large modules behind feature flags to release in parts, and work the unglamorous layer: encoding corruption in extracted PDFs, pagination and timezone edge cases.

PHP Full-Stack Developer — Solbyte

August 2025 - April 2026

Web agency — client projects in PHP/Laravel, REST APIs and WordPress

- Delivered **8+ client projects** in PHP and Laravel to fixed agency deadlines: custom booking platforms, CRM/ERP work and internal tools, owning routing, controllers and views.
- Built in-house REST APIs and integrated third-party ones, and automated recurring workflows end to end, including DNS and Cloudflare configuration for the sites I shipped.
- Built and maintained around **10 WordPress sites**, with custom PHP plugins where the off-the-shelf ones did not fit.

Web Developer — Patrimar Inversiones (Internship)

April 2025 - June 2025

Built the company web platform in PHP, JavaScript, HTML and CSS in a two-person team — github.com/Sergio8spider/webpatrimar

SELECTED PROJECT

Libro de Trayectos — shared ledger for car journeys (Laravel, PWA)

trayectos.onrender.com

- Computes what a car trip actually costs — including the effect of elevation gain, and the ceiling on how much of a descent a hybrid's battery can actually absorb — and splits it between passengers using **double-entry bookkeeping**: every trip is a journal entry whose lines sum to zero, enforced by a deferred PostgreSQL trigger so no script can unbalance the ledger. Money in integer cents throughout.
- Live distance and elevation from OpenRouteService, degrading in steps to a straight-line and altitude estimate when a free quota runs out; official ministry fuel prices and grid electricity rates for EVs; each trip frozen in an immutable cost snapshot. Installable PWA, iOS included. Dockerised on Render with Postgres on Neon and scheduled tasks on GitHub Actions, **running at zero cost**. Source: github.com/ide-la-r/Trayectos.

TECHNICAL SKILLS

Languages: PHP 8, JavaScript, Python, SQL

Backend: Laravel, Filament, REST APIs, queues & scheduled jobs, MySQL, PostgreSQL, Redis, PHPUnit/Pest

Frontend: Blade, Livewire, Tailwind CSS, HTML, Sass · **Learning:** Pandas, C, Java

Platform: Git, Linux, Bash, Docker, Laravel Forge, Render, Cloudflare/DNS, GitHub Actions, WordPress

AI engineering: OpenAI / Anthropic / Gemini APIs, prompt and cost engineering, coding agents in daily workflow

EDUCATION

Higher Technician Diploma in Web Development — MEDAC Nova, Málaga

2023 - 2025

EQF Level 5, two years post-secondary (Spanish *Grado Superior* in Web Application Development).

42 Málaga — Fundación Telefónica

2024 - 2026

Selective full-time C and Unix immersion (*Piscine*) plus the opening projects of the peer-to-peer cursus.

Also: Specialisation Course in Python Application Development, CPIFP Alan Turing (2025-2026) · Technician Diploma in Microcomputer Systems & Networks, IES Gerald Brenan (2021-2023, EQF Level 4) · Cisco certifications: Python Essentials 2, CCNAV7, IT Essentials.

Languages: Spanish — native · English — B2 (Trinity), used daily in written technical work.
